Series Number: IV

Number of Pages: 394

Abstract: This publication is one of a series of reports presenting socio-economic data for small areas within Maryland. The report contains tabulations and maps pertaining to labor force participation and employment characteristics. The data are derived from the 1970 Census of Population and Housing.

The report provides basic data for election districts and places with a population of 2,500 persons or more in 1970. Labor force participation rates of the male and female sectors of the population are detailed by race for specific age groups; employment data are structured to show the occupational mix of the population by race and sex. Selected indicators are mapped by region at the election district level.

This report is designed to facilitate studies of the socio-economic characteristics of local areas, and to establish causal relationships among indicators for use in the identification of local problems. This type of data bank is most useful to planning agencies at the State, regional, county or local level.

June 15, 1974

The Honorable Marvin Mandel  
Governor of Maryland  
State House  
Annapolis, Maryland 21404

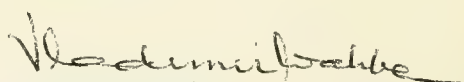

Dear Governor Mandel:

I am pleased to transmit herewith the report entitled "Maryland 1970 Social Indicator Series, Volume IV: Labor Force and Employment Characteristics". This report is the fourth in a series designed to provide information of analytical significance on the socioeconomic status of the population in Maryland by small areas.

Based upon data retrieved from the 1970 Census of Population and Housing regarding labor force participation and occupational characteristics of persons residing in Maryland, it is anticipated that the report will be useful in program planning at the local, county and regional levels.

Copies of the report are being distributed to interested agencies and individuals throughout the State.

Sincerely,

  
Vladimir Wahbe

Enclosure

## I. LABOR FORCE AND EMPLOYMENT CHARACTERISTICS

The Labor Force and Employment Characteristics report quantifies two aspects of Maryland's human resource base, namely, the participation rates of several age segments of the adult population and the occupational mix of the employed civilian labor force. The data in this report provide a means of evaluating relative levels of social and economic well-being within specific segments of an area's population.

The census attributes used to describe an area's labor force details participation rates by age, race and sex. Labor force participation is dependent upon the relative number of job opportunities in an area and, to a more limited extent, to intervening opportunities such as the availability of educational facilities. These data provide insight, at the local level, into labor force participation of specific racial groups, the importance of female participation in the economic development of an area, the contribution of specific age groups to the resident labor force, and the degree of utilization of the existing human resource stock. When used in conjunction with the other reports of the series, the data can assist in the identification and quantification of chronic economic problems, and provide an input into studies designed to resolve the problems at a local or regional scale.

The inclusion of data referring to the occupation of employed persons by sex, provide for an understanding of the economy of an area, as the observed occupational mix reflects the type of economic activities in which the area is engaged. For example, an area which specializes in trade and services would tend to have a high proportion of persons employed in clerical and sales, managerial, administrative or proprietary positions, as well as in professional occupations. The employment and labor force data cannot be directly compared because of definitional constraints, however, the data are

mutually supportive in identifying related problems of occupational mix and labor force participation. For example, low participation rates for a certain population group may reflect the withdrawal of members of that group from the labor force because of a lack of suitable employment opportunities. These data are also related to educational characteristics and income levels. Educational attainment levels have a significant impact on the observed occupational mix, which in turn is highly correlated with income levels, particularly income derived from wage and salary sources.

Statistics tabulated for the white and nonwhite sectors of the population at the minor civil division (MCD) or place level (for areas outside the two metropolitan regions and Southern Maryland Region) should be interpreted with some caution. In some areas, the small size of the resident population that is classified as nonwhite makes comparisons of relative statistics with the white sector difficult. The user is advised to refer to the Age and Mobility Characteristics report to clarify the size and age-sex composition of the local population for such areas.

## II. DESCRIPTION OF LABOR FORCE AND EMPLOYMENT INDICATORS

### Labor Force Data

Information pertaining to labor force and employment is derived from the twenty percent sample in the 1970 Census of Population. The data provided in this report include total labor force by race and sex, and participation rates, by age, race and sex. Labor Force participation rates are calculated for persons 16 to 64 years old, which includes that portion of the population that is most active in the labor force. Participation rates for persons sixty-five years of age and over tend to be considerably lower than those for the remainder of the labor force and are not considered sufficiently significant in explaining aspects of economic development for small areas to warrant their inclusion in this report.

Participation rates are provided for three specific age groups as well as the total adult population. The first age group, persons sixteen to twenty-four, includes entrants into the labor force and students enrolled in school. Rates are generally lower for this group than for the remainder of the labor force, partially reflecting the presence of persons in this population group who are continuing their education past the age of compulsory attendance. The comparison of the participation rates and school attendance rates for this age group should be undertaken when attempting to interpret either statistic, and when attempting to determine the relative attractiveness of the two alternatives for different races and sexes.

Participation rates for the other two age groups, 25-44 and 45-64 display significant differences in labor force participation. Lower rates for the older age group, for example, generally reflect the effect of factors such as age, health, income requirements and lower median education levels on degree of labor force participation.

### Employment Data

The employment indicators provided here refer to persons fourteen years of age and older who are members of the civilian labor force, and employed. These data are not directly comparable with the labor force data, as the latter refer to persons sixteen years of age and older who are either employed, unemployed, or in the armed forces. This means, in effect, that an accurate estimate of unemployment cannot be determined for an area unless it is known that there are no persons between fourteen and sixteen years of age who were employed or who were members of the armed forces.

The twelve occupational categories used by the Census are reduced to eight by combining "sales workers" with "clerical and kindred workers", "operatives, except transport" with "transport equipment operators", "farmers and farm managers" with "farm laborers and foremen", and "service workers, except private household" with "private household workers". The category "occupation not reported", is not listed although the respondents in that category are included in the count of all employed persons. As a result, the sum of the percentage distribution calculations for employed persons does not always total to one hundred percent.

### III. REVIEW OF STATISTICS

A series of computer maps<sup>1</sup> is prepared for use in this report series. The mapping of data is used in this report to assist in visual comparisons of the labor force and employment characteristics at the MCD level of detail. In addition, occupational breakdowns are put into four groups: white collar workers, blue collar workers, farm workers, and service workers which are mapped for each region. The consistent mapping of attributes in the report series assists in identification of recurring spatial relationships and analysis of performance of individual indicators.

The following section emphasizes the comparability of and inter-relationships between the data contained in this report and the data included in the other reports of this series. This report is designed to facilitate in the preparation of multivariate studies to determine socioeconomic status of local areas, and to identify causal relationships between indicators for use in the identification of local problems.

#### A. Labor Force

The labor force data are useful in characterizing several aspects of an area's socioeconomic status.

1. In another report of this series, Age Composition and Mobility Characteristics, the use of an indicator referred to as the "dependency ratio" is discussed. This ratio describes the number of persons classified as "non-productive", relative to those who are "productive". That definition is quite crude, as it defined the two groups by age rather than utilizing other data delineating persons who are actually "productive" or "non-productive".

---

<sup>1</sup> The initial program to generate computer maps was provided by Dr. David Cowen and Dr. Paul Lovingood, Department of Geography, University of South Carolina.

Consequently, the labor force participation rates can be used to provide a further dimension to this statistic, by describing the proportion of persons in the "productive" age groups who are indeed "productive", that is, members of the labor force. This concept is quite useful in analyzing participation rates themselves. For example, in comparing the white and nonwhite labor force participation rates, it is obvious that a smaller proportion of nonwhite males are in the labor force than is noted for white males. Conversely, the participation rates for nonwhite females are much higher than for white females. This suggests that there are proportionately more dependent white females and nonwhite males in the prime age groups. This indicator may be useful for analyzing differences in income and poverty level by race, and refining statistics determining the relative size of the dependent population by race.

2. Differences between white and nonwhite participation rates are very significant at both the local and state levels. However, these data should be interpreted with some caution in MCD's or places with a small nonwhite population base, in particular, the Western Maryland Region and the rural parts of the State. Traditionally, female nonwhite participation rates have remained relatively high. This is due in part to low educational attainment levels of nonwhite males, the tendency for employers to hire nonwhite females in unskilled occupations and the need to support a family. The data presented in the Educational Characteristics report tend to support the first point, the data detailing occupational mix of employed persons reflect the second assertion, and the poverty status data contained in the Income Characteristics report appear to reinforce the third point. Studies attempting to explain local labor force participation patterns or income distribution would involve the study of such indicators as those outlined above.

3. An interesting difference in participation rates for white and nonwhite females is evident from analyzing the data. Participation rates of

white and nonwhite females are higher for those 25 to 44 years old than for those 16 to 24 years old with the exception of white females in the metropolitan regions, where the reverse is true. This observation reflects the interplay of a complex set of factors which affect female labor force participation. Participation rates for the younger age group are affected by the availability of educational facilities as well as job opportunities.

4. Some variations in participation rates can be attributed to age characteristics and geographic differences. For example, low participation rates for males sixteen to twenty-four partially reflect the attractiveness of continuing education as an alternative to entering the labor force. Geographical variations may reflect differences in availability of educational programs while differences between white and nonwhite males may also reflect the difficulties experienced by nonwhites in obtaining employment, and thus remaining in the labor force. Here again, the data can assist in identifying local structural problems in the labor supply, income and poverty level, and educational opportunities. The locational detail provided in this report should assist programs designed to reach potential labor force participants.

## B. Employment and Occupation

The breakdown of employment characteristics by major occupation groups is a useful tool in describing area differences in labor supply.

1. The data are displayed to highlight the differences in occupational composition by sex. The two occupational groups which contain the largest proportion of employed men are "professional, technical, and kindred workers" and "craftsmen, foremen and kindred workers". For females the equivalent occupational groups are "clerical and sales" and "professional, technical and kindred workers", with "service workers" a close third. Em-

ployment in the professional and clerical categories appears to be higher in urban areas, reflecting the service-oriented functions of urban areas.

2. Significant differences in occupational breakdown by race and sex are also evident. The most prominent occupational groups for nonwhite males are "operative" and "service workers". A high proportion of nonwhite females are employed as "service workers" or "sales and clerical" personnel. These occupations tend to require a lower level of educational attainment and also tend to be less remunerative than the occupations with the highest proportion of employed white persons. This data, when compared with the educational attainment and income information, can be useful for analyzing the relationships between income levels and race. It also can be of assistance in undertaking socioeconomic analyses for planning purposes and for determining the need for adult educational programs.

3. Occupational data can be used to categorize economic activity for an area. For example, the two metropolitan areas show a high concentration of white collar employment. The accompanying maps indicate that the concentration is strongest along the Baltimore-Washington urban corridor and extends east to include the Annapolis area. The corridor is evident for both white and nonwhite employed persons, but is wider for whites. In the Washington-Annapolis areas, the dominance of the federal and State governments as employers tend to support a large white collar labor force. The emphasis on equal opportunity employment in federal and State employment also supports the high concentration of nonwhite white collar workers. In addition, the ancillary trade and service industries tend to reinforce the concentration of white collar workers in the Baltimore and Washington urban areas. The differences in the economic base of the two metropolitan areas is highlighted by the differences in occupational mix. While both show high concentrations of professional, technical and kindred workers, this is the largest occupa-

tional category only in the Washington area. In the Baltimore Region, blue collar occupations, such as operatives and craftsmen, foremen and kindred workers, are the dominant occupations. This indicates the importance of manufacturing as an employer in the Baltimore Region.

4. Comparison of occupational mix of the white and nonwhite employed persons in the Baltimore Region suggests that the type of employment varies significantly by race. The majority of whites are occupied in white collar occupations, with a large proportion of the remainder employed as craftsmen and in related occupations. For the nonwhite employed persons, on the other hand, the majority are employed in blue collar occupations. The implications that can be drawn from the data can facilitate the planning and development of adult education and equal opportunity programs.

#### IV. SUMMARY

Variations in labor force status and employment characteristics due to race, sex and locational factors highlight the differences in economic status observed for different population groups. The observations reinforce the inferences drawn regarding the performance of these groups with respect to the other socioeconomic characteristics in this report series.

Labor force and employment characteristics are very closely related to income characteristics. It is evident that areas with low income levels and sizeable pockets of poverty also have low participation rates, and employ a large proportion of blue collar, service and agricultural workers. This is quite evident in the Western Maryland and Eastern Shore regions, where the occupational mix suggests that economic activity is less pronounced than in the urbanized regions. Differences related to race and sex can also be associated with income attributes. The data indicate that nonwhite males tend to obtain employment in the occupations which traditionally offer lower wages and salaries than those occupations that attract a large proportion of white males. Similarly, nonwhite females tend to be employed in occupations that are low paying relative to white females, although their participation rates are generally higher. This latter observation may be related to the lower wages and salaries and relative scarcity of job opportunities for nonwhite males relative to white males.

The indicators presented in this report are designed to describe the labor force and employment status of different population groups for small areas in Maryland and to contribute to the body of interrelated socioeconomic data tabulated for small areas in Maryland. The data it-

self can be used to analyze and compare differences in local labor force participation or occupational mix. More significantly, they can be used in concert with the other data in this series to describe the existing socioeconomic development of small areas in order to identify and ultimately resolve chronic problems. This type of data bank is most useful to planning agencies at the State, regional, county or urban level. It is hoped that it will also assist private agencies and individuals in understanding the complex interaction of social and economic forces that fashion the State's economy.

## V. GUIDE TO USING THE DATA

The county level data are ordered alphabetically by region. The statistics for minor civil divisions (MCD's), election districts in most of Maryland, are additive to the county totals. Data for urban places are presented separately, as MCD boundaries cannot always be equated with those of a defined urban center. In some cases the county total derived from adding the MCD data differs slightly from the total given on the State summary tables. In these instances full data disclosure is not presented at the MCD level in order to insure confidentiality of responses in areas where there are very few individual responses from specific population groups. This may occur in sparsely populated areas or areas with a very small nonwhite population. In such cases, a minus one (-1) in the data at the MCD level may indicate such suppression of data.

Unincorporated centers are indicated by the letter "U" in parenthesis after the place name. In cases where an urban place straddles two counties, this is indicated by the term "part", in parentheses, after the place name.

The accompanying maps can be used to assist in interpreting the MCD data for county, regional, or even State perspective. The degree of differentiation or homogeneity between contiguous areas with respect to a single or several indicators can be observed readily using the mapping technique. For example, the existence of a Baltimore-Washington corridor of high performance in certain indicators can be readily observed using the mapping technique.

The consistent use of a graduated set of symbols for data ranges can indicate the relative performance of a specific area, compared to other areas, for several indicators. The symbols highlight the existence or absence of spatial patterns of performance both within and across adjacent regions.

The maps can assist in the identification of areas which exhibit unusual performance with respect to a particular indicator. This can be useful in detecting areas which are strongly influenced by overriding factors such as population density or accessibility to urban areas. Urban-rural patterns of performance can be readily identified, which assists in the analysis of the data as presented in tabular form.

The maps provided in this report are only a selection of what are considered the more significant attributes. In the Labor Force and Employment Characteristics report, all mapped indicators can be derived from the tables presented in the report. The user is thus able to compare the actual value of a certain attribute for a specified area, and the relative performance of that area with respect to a defined range of values.

## VI. DEFINITIONS<sup>2</sup>

### Geographic Areas

Minor Civil Divisions--These are the primary political and administrative sub-divisions of a county. In Maryland, it usually corresponds to an election district.

### Population Census Concepts

Urban-rural residence--This is one of the most important breakdowns of the population by geographic residence. Geographic areas are classified as urban or rural on the basis of their population size or density at the time of the census.

1. Urban population--Generally, all persons residing in areas determined to be urbanized areas or in places of 2,500 or more outside urbanized areas. A common breakdown of the urban population is given below.

- i) Population in central cities of urbanized areas.

- ii) Population in urban fringe of urbanized areas.

Population in urbanized areas but not in central city.

- iii) Other urban population outside urbanized areas.

Population in places of 2,500 or more outside urbanized areas.

2. Rural population--Population not classified as urban constitutes the rural population.

Race--This refers to the division of the population into white, Negro, and several other racial categories. These racial categories do not correspond to strict scientific definitions of biological

---

<sup>2</sup> Excerpted from the Census Users' Dictionary, U.S. Department of Commerce, 1970 CENSUS USERS' GUIDE, Part I, 1970.

stock. Persons were asked to indicate their race by selecting one of the following: White; Negro or Black; Indian (American); Japanese; Chinese; Filipino; Hawaiian; Korean; Other (specify). (In Alaska, Hawaiian and Korean were omitted and Aleut and Eskimo were added.)

#### Labor Force and Employment Concepts

Labor force status--This is ascertained for persons 14 years of age and over as of the calendar week prior to date of enumeration (reference week). In 1970, most labor force tabulations will be presented for persons 16 years and over.

1. Labor force--This includes persons classified as employed or unemployed plus members of the Armed Forces.
2. Not in labor force--This includes all persons 14 and over not classified as members of the labor force, including persons doing only incidental unpaid work on a family farm or business (less than 15 hours during the reference week). Most of the persons in this category are students, housewives, retired workers, seasonal workers enumerated in an "off" season who are not looking for work, inmates of institutions, or persons who cannot work because of long-term physical or mental illness or disability.
3. Employed--This includes civilians 14 years and over who during the reference week were either "at work"--who did any work for pay or profit or worked without pay for 15 hours or more on a family farm or business; or "with a job but not at work"--were temporarily absent because of reasons such as illness, vacation, etc.

4. Occupation--This is ascertained for persons 14 years of age and over in the experienced civilian labor force or in the labor reserve. Employed persons were to report the occupation at which they worked the most hours during the reference week.

The occupation classification scheme employee in 1970 is fully described in Bureau of the Census, 1970 Census of Population, Classified Index of Occupations and Industries, available from the Superintendent of Documents.

#### 1970 Census Major Occupation Groups

1. Professional, technical and kindred workers
2. Farmers and farm managers
3. Managers, Officials, and Proprietors, except farm
4. Clerical and kindred workers
5. Sales Workers
6. Craftsmen, foremen, and kindred workers
7. Operatives and kindred workers, except transport equipment operatives
8. Transport equipment operatives
9. Private household workers
10. Service workers, except private household
11. Farm laborers and foremen
12. Laborers, except farm and mining
13. Occupation not reported

The major groups and the occupational areas to which they relate are as follows:

1970 Major Occupational Groups	Occupational Areas
Professional, technical, and kindred workers	
Managers and administrators, except farm	White collar workers
Sales workers	
Clerical and kindred workers	
Craftsmen and kindred workers	
Operatives, except transport	Blue collar workers
Transport equipment operatives	
Laborers, except farm	
Farmers and farm managers	
Farm laborers and farm foremen	Farm workers

Service workers, except  
private household  
Private household workers

Service  
workers

Participation Rate--This refers to the number of persons of a particular population group who are members of the labor force.
